

Sample Solutions ▼

Objectives

- Introduction to Perl programming.

Preparation

Before the lab you should re-read the relevant lecture slides and their accompanying examples.

Getting Started

Create a new directory for this lab called **lab04** and change to this directory with these commands:

```
$ mkdir lab04
$ cd lab04
```

Exercise: Deja Vu - Mapping Digits but in Perl

Write a Perl script `digits.pl` that reads from standard input and writes to standard output mapping all digit characters whose values are less than 5 into the character '<' and all digit characters whose values are greater than 5 into the character '>'. The digit character '5' should be left unchanged.

[illegible]

When you think your program is working you can use `autotest` to run some simple automated tests:

```
$ 2041 autotest perl_digits
```

When you are finished working on this exercise you must submit your work by running **give:**

```
$ give cs2041 lab04_perl_digits digits.pl
```

Sample solution for `digits.pl`

```
#!/usr/bin/perl -w
while ($line = <STDIN>) {
    $line =~ s/[0-4]/</g;
    $line =~ s/[6-9]/>/g;
    print $line;
}
```

Alternative solution for `digits.pl`

```
#!/usr/bin/perl -w
# using the implicit variable $_
while (<STDIN>) {
    s/[0-4]/</g;
    s/[6-9]/>/g;
    print;
}
```

Alternative solution for `digits.pl`

```
#!/usr/bin/perl -w
while (<STDIN>) {
    tr/0-9/<<<<5>>>>/;
    print;
}
```

Exercise: Echoing A Shell Exercise in Perl?

Write a Perl script `echon.pl` which given exactly two arguments, an integer n and a string, prints the string n times. For example:

```
$ ./echon.pl 5 hello
hello
hello
hello
hello
hello
$ ./echon.pl 0 nothing
$ ./echon.pl 1 goodbye
goodbye
```

Your script should print exactly the error message below if it is not given exactly 2 arguments:

```
$ ./echon.pl
Usage: ./echon.pl <number of lines> <string>
$ ./echon.pl 1 2 3
Usage: ./echon.pl <number of lines> <string>
```

Also get your script to print this error message if its first argument isn't a non-negative integer:

```
$ ./echon.pl hello world
./echon.pl: argument 1 must be a non-negative integer
$ ./echon.pl -42 lines
./echon.pl: argument 1 must be a non-negative integer
```

When you think your program is working you can use **autotest** to run some simple automated tests:

```
$ 2041 autotest perl_echon
```

When you are finished working on this exercise you must submit your work by running **give**:

```
$ give cs2041 lab04_perl_echon echon.pl
```

Sample solution for echon.pl

```
#!/usr/bin/perl -w
if (@ARGV != 2) {
    die "Usage: $0 <number of lines> <string>\n";
}
if ($ARGV[0] !~ /\d+$/) {
    die "$0: argument 1 must be a non-negative integer\n";
}
foreach ($i=0; $i < $ARGV[0]; $i++) {
    print "$ARGV[1]\n";
}
```

Alternative solution for echon.pl

```
#!/usr/bin/perl -w
die "Usage: $0 <number of lines> <string>\n" if @ARGV != 2;
die "$0: argument 1 must be a non-negative integer\n" if $ARGV[0] !~ /\d+$/;
foreach (1..$ARGV[0]) {
    print "$ARGV[1]\n";
}
```

Alternative solution for echon.pl

```
#!/usr/bin/perl -w
die "Usage: $0 <number of lines> <string>\n" if @ARGV != 2;
die "$0: argument 1 must be a non-negative integer\n" if $ARGV[0] !~ /\d+$/;
print "$ARGV[1]\n" foreach 1..$ARGV[0];
```

Alternative solution for echon.pl

```
#!/usr/bin/perl -w
die "Usage: $0 <number of lines> <string>\n" if @ARGV != 2;
die "$0: argument 1 must be a non-negative integer\n" if $ARGV[0] !~ /\d+$/;
print "$ARGV[1]\n" x $ARGV[0];
```

Exercise: A Perl Tail

Perl file manipulation

The standard approach in Perl for dealing with a collection of files whose names are supplied as command line arguments, is something like:

```
#!/usr/bin/perl -w
foreach $arg (@ARGV) {
    if ($arg eq "--version") {
        print "$0: version 0.1\n";
        exit 0;
    }
    # handle other options
    # ...
} else {
    push @files, $arg;
}
}

foreach $file (@files) {
    open F, '<', $file or die "$0: Can't open $file: $!\n";

    # process F

    close F;
}
```

Write a Perl script to implement the Unix **tail** command. It should support the following features of **tail**:

- read from files supplied as command line arguments
- read from standard input if no file name arguments are supplied
- display the error message **tail.pl: can't open *FileName*** for any unreadable file
- display the last N lines of each file (default $N = 10$)
- can adjust the number of lines displayed via an optional first argument $-N$
- if there is more than one named file, separate each by **==> *FileName* <==**

To assist with testing your solution, there are three small test files: [t1.txt](#), [t2.txt](#), and [t3.txt](#). Copy these files to your current directory.

```
$ cp /web/cs2041/19T2/activities/perl_tail/t?.txt .
```

Using these data files, your program should behave as follows:

```

$ ./tail.pl <t1.txt
Data 1 ... Line 2
Data 1 ... Line 3
Data 1 ... Line 4
Data 1 ... Line 5
Data 1 ... Line 6
Data 1 ... Line 7
Data 1 ... Line 8
Data 1 ... Line 9
Data 1 ... Line 10
Data 1 ... Last line
$ ./tail.pl t1.txt
Data 1 ... Line 2
Data 1 ... Line 3
Data 1 ... Line 4
Data 1 ... Line 5
Data 1 ... Line 6
Data 1 ... Line 7
Data 1 ... Line 8
Data 1 ... Line 9
Data 1 ... Line 10
Data 1 ... Last line
$ ./tail.pl -5 t1.txt
Data 1 ... Line 7
Data 1 ... Line 8
Data 1 ... Line 9
Data 1 ... Line 10
Data 1 ... Last line
$ ./tail.pl -5 t2.txt
A one line file.
$ ./tail.pl -5 t1.txt t2.txt t3.txt
==> t1.txt <==
Data 1 ... Line 7
Data 1 ... Line 8
Data 1 ... Line 9
Data 1 ... Line 10
Data 1 ... Last line
==> t2.txt <==
A one line file.
==> t3.txt <==
one
word
on
each
line
$ ./tail.pl -2 tX.txt
./tail.pl: can't open tX.txt

```

Hint: use the above template for Perl file processing to get started with your script. You *must* use Perl's `-w` flag in your script, and you must write your code in such a way as to ensure that no warning messages are produced.

When you think your program is working you can use **autotest** to run some simple automated tests:

```
$ 2041 autotest perl_tail
```

When you are finished working on this exercise you must submit your work by running **give**:

```
$ give cs2041 lab04_perl_tail tail.pl
```

Sample solution for `tail.pl`

```
#!/usr/bin/perl -w

$max_lines = 10;

if (@ARGV > 0 && $ARGV[0] =~ /\-([0-9]+)/) {
    $max_lines = $1;
    shift @ARGV;
}

if (@ARGV == 0) {
    @lines = <>;
    $first = @lines - $max_lines;
    $first = 0 if $first < 0;
    print @lines[$first..$#lines];
} else {
    $show_file_names = @ARGV > 1;
    foreach $file (@ARGV) {
        open my $f, '<', $file or die "$0: can't open $file\n";
        print "==> $file <==\n" if $show_file_names;
        @lines = <$f>;
        $first = @lines - $max_lines;
        $first = 0 if $first < 0;
        print @lines[$first..$#lines];
        close $f;
    }
}
```

Challenge Exercise: Shuffling Lines

Write a Perl script `shuffle.pl` which prints its input with the lines in random order. For example, lets create a file containing the integers 0..4.

```
$ seq 0 4 >numbers.txt
```

Now if we run `shuffle.pl` taking its input from this file it should print the lines in a different order each time its run, for example:

```
$ cat numbers.txt
0
1
2
3
4
$ ./shuffle.pl <numbers.txt
0
3
1
4
2
$ ./shuffle.pl <numbers.txt
3
0
2
4
1
$ ./shuffle.pl <numbers.txt
3
1
4
0
2
```

You are not permitted to use `List::Util` (it contains a shuffle function).

Don't look for other people's solutions - see if you can come up with your own. **Hint:** the perl function *rand* returns a floating point number between 0 and its argument. For example:

```
$ perl -e 'print rand(42), "\\n"'
30.8158004966773\n
```

```
$ perl -e 'print rand(42), "\\n"'
5.52169412637355\n
```

Hint: perl ignores the fractional part of a number if you use it to index an array. There is no autotest and no automarking of this question.

When you have completed demonstrate your work to another student in your lab and ask them to enter a [peer assessment here](#)

It is preferred you do this during your lab, but if this is not possible you may demonstrate your work to any other COMP(2041|9044) student before Tuesday 02 July 17:59:59. Note, you must also submit the work with give.

When you are finished working on this exercise you must submit your work by running **give**:

```
$ give cs2041 lab04_perl_shuffle shuffle.pl
```

Sample solution for `shuffle.pl`

```
#!/usr/bin/perl -w
# simple implementation of http://en.wikipedia.org/wiki/Fisher-Yates_shuffle
@lines = <>;
print splice(@lines, rand(@lines), 1) while @lines;
```

Alternative solution for `shuffle.pl`

```
#!/usr/bin/perl -w
use List::Util 'shuffle';
print shuffle(<>);
```

Challenge Exercise: Testing a Non-determinate Program

There is no dryrun test for `shuffle.pl`. Testing (pseudo)random programs is more difficult because there are multiple correct outputs for a given input.

Write a shell script `shuffle_test.sh` which tests `shuffle.pl`.

Try to test that all outputs are correct and all correct outputs are being generated.

Sample solution that just checks coverage

```
#!/bin/sh

input=/tmp/shuffle_test0$$
output=/tmp/shuffle_test1$$
sorted_output=/tmp/shuffle_test2$$
all_output=/tmp/shuffle_test3$$

number_of_lines=4
number_of_test_runs=256

# create an input file with 1 integer per line in sorted order
# and calculate how many permutations are possible
i=1
factorial=1
while test $i -le $number_of_lines
do
    echo $i
    factorial=$((factorial * $i))
    i=$((i + 1))
done >$input

run=1
while test $run -le $number_of_test_runs
do
    ./shuffle.pl <$input >$output
    sort -n $output >$sorted_output

    # after sorting output should be identical to input
    if diff $sorted_output $input >/dev/null
    then
        # append result of this execution to $all_output as a single line
        echo `cat $output` >>$all_output
    else
        echo Testing failed, input was:
        cat $input
        echo Testing failed, output was:
        cat $output
        exit 1
    fi
    run=$((run + 1))
done

n_different_outputs=`sort $all_output|uniq|wc -l`
if test $n_different_outputs -eq $factorial
then
    echo All possible outputs produced
    exit 0
else
    echo In $number_of_test_runs executions only $n_different_outputs of $factorial outputs produced
    exit 1
fi

rm -f $input $output $sorted_output $all_output
```

A more elaborate solution from Donny Yang which takes a more statistical approach

```
#!/bin/sh

input=/tmp/shuffle_test0$$
output=/tmp/shuffle_test1$$
sorted_output=/tmp/shuffle_test2$$
all_output=/tmp/shuffle_test3$$

number_of_lines=4
number_of_test_runs=256

# create an input file with 1 integer per line in sorted order
# and calculate how many permutations are possible
i=1
factorial=1
while test $i -le $number_of_lines
do
    echo $i
    factorial=$((factorial * $i))
    i=$((i + 1))
done >$input

run=1
while test $run -le $number_of_test_runs
do
    ./shuffle.pl <$input >$output
    sort -n $output >$sorted_output

    # after sorting output should be identical to input
    if diff $sorted_output $input >/dev/null
    then
        # append result of this execution to $all_output as a single line
        echo `cat $output` >>$all_output
    else
        echo Testing failed, input was:
        cat $input
        echo Testing failed, output was:
        cat $output
        exit 1
    fi
    run=$((run + 1))
done

n_different_outputs=`sort $all_output|uniq|wc -l`
if test $n_different_outputs -eq $factorial
then
    echo All possible outputs produced
    exit 0
else
    echo In $number_of_test_runs executions only $n_different_outputs of $factorial outputs produced
    exit 1
fi

rm -f $input $output $sorted_output $all_output
```

There is no autotest and no automarking of this question.

When you have completed demonstrate your work to another student in your lab and ask them to enter a [peer assessment here](#)

It is preferred you do this during your lab, but if this is not possible you may demonstrate your work to any other COMP(2041|9044) student before Tuesday 02 July 17:59:59. Note, you must also submit the work with give.

When you are finished working on this exercise you must submit your work by running **give**:

```
$ give cs2041 lab04_shuffle_test shuffle_test.sh
```

Sample solution for `shuffle_test.sh`

```
#!/bin/sh

input=/tmp/shuffle_test0$$
output=/tmp/shuffle_test1$$
sorted_output=/tmp/shuffle_test2$$
all_output=/tmp/shuffle_test3$$

number_of_lines=4
number_of_test_runs=256

# create an input file with 1 integer per line in sorted order
# and calculate how many permutations are possible

Submission

When you are finished each exercises make sure you submit your work by running **give**. You can run **give** multiple times. Only your last submission will be marked.

Don't submit any exercises you haven't attempted.

If you are working at home, you may find it more convenient to upload your work via [give's web interface](#).

Remember you have until **Tuesday 02 July 17:59:59** to submit your work.

You cannot obtain marks by e-mailing lab work to tutors or lecturers.

You check the files you have submitted [here](#)

Automarking will be run by the lecturer several days after the submission deadline for the test, using test cases that you haven't seen: different to the test cases `autotest` runs for you.

(Hint: do your own testing as well as running `autotest`)

After automarking is run by the lecturer you can [view it here](#) the resulting mark will also be available via [via give's web interface](#)

Lab Marks

When all components of a lab are automarked you should be able to view the the marks [via give's web interface](#) or by running this command on a CSE machine:

```
$ 2041 classrun -sturec
```

The lab exercises for each week are worth in total 1.2 marks.

Usually each lab exercise will be worth the same - for example if there are 5 lab exercises each will be worth 0.4 marks.

Except challenge exercises (see below) will never total more than 20% of each week's lab mark.

All of your lab marks for weeks 1-10, will be summed to give you a mark out of 12.

If their sum exceeds 9 - your total mark will be capped at 9.

Running Autotests On your Own Computer

An experimental version of autotest exists which may allow you to run autotest on your own computer.

If you are running Linux, Windows Subsystem for Linux or OSX. These commands might let you run autotests at home.

```
$ sudo wget https://cgi.cse.unsw.edu.au/~cs2041/19T2/resources/home_autotest -O/usr/local/bin/2041_autotest
$ sudo chmod 755 /usr/local/bin/2041_autotest
$ 2041_autotest shell_snapshot
```

Autotest itself needs Python 3.6 (or later) installed.

Particular autotests may require other software install, e.g. autotests of perl programs require Perl installed (of course).

The legit autotests need python3.7, git & binfmt-support installed.

The program embeds the autotests themselves, so you'll need to re-download if autotests are changed, added, fixed, ...

If it breaks on your computer post on the class forum and we'll fix if we can, but this is very definitely experimental.

COMP(2041|9044) 19T2: Software Construction is brought to you by
the [School of Computer Science and Engineering](https://cse.unsw.edu.au/~cs2041/19T2/lab/04/answers) at the [University of New South Wales](https://unsw.edu.au), Sydney.

For all enquiries, please email the class account at cs2041@cse.unsw.edu.au
